The First Personal Computing Revolution

Who was this? Where? When?

The young man could hardly contain his excitement. He was sure the invention he had just seen could change the world. It would usher in a new era of personal computing. No longer would a businessman or trader have to rely on a member of the select brotherhood of computing professionals to crunch the numbers. He could do it himself.

The people who showed him the invention were fascinated by how it worked, but they clearly did not see what the young man could: its huge commercial potential. As so often happens in history, the right person was in the right place at the right time. Not only had the young man shown mathematical talent at an early age, he had grown up in what was then the acknowledged world capital for innovation, particularly in the business world. He also had the savvy to know how to make the invention available to ordinary citizens. The trick was to package and market it to them directly, in a way that they could at once appreciate and understand.

Within a few years, the young man had succeeded beyond all expectations – save perhaps for his own far-sighted vision. The personal computing revolution was underway, new businesses were being created, new ways of carrying out international trade and commerce were developing, new financial institutions were being established, and new fortunes were being made. The world would never be the same again.

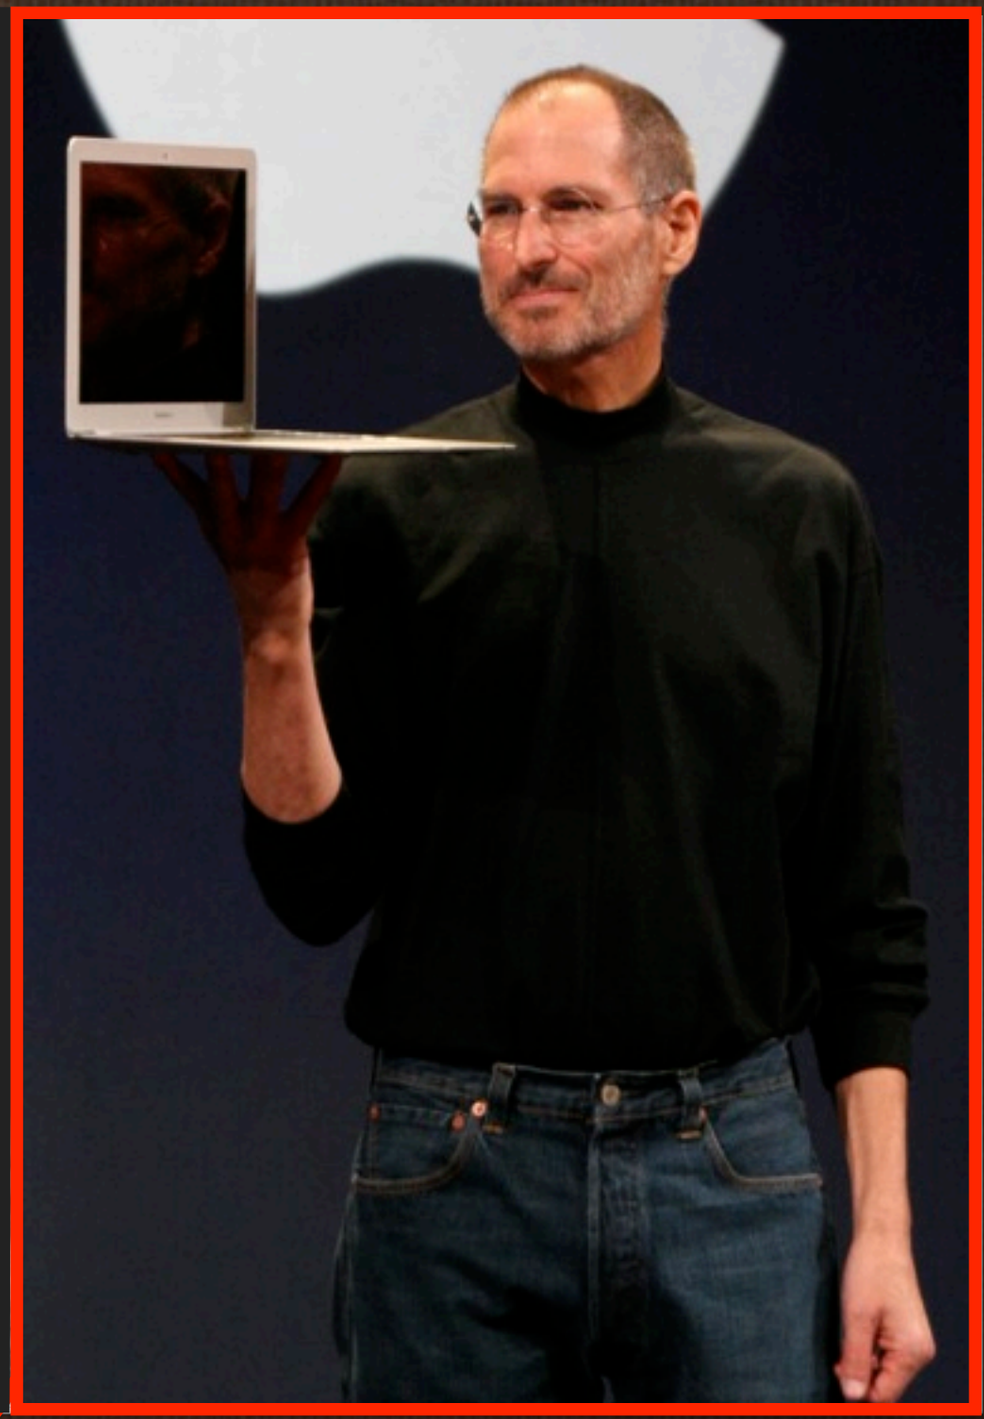
The comparison



Leonardo Fibonacci

Leonardo Fibonacci

- Lived from around 1170 to around 1250; spent most of his life in Pisa. Father an international businessman.

Leonardo Fibonacci

- Lived from around 1170 to around 1250; spent most of his life in Pisa. Father an international businessman.
- Traveled to Bugia, in North Africa, as a teenager to join his father.

Leonardo Fibonacci

- Lived from around 1170 to around 1250; spent most of his life in Pisa. Father an international businessman.
- Traveled to Bugia, in North Africa, as a teenager to join his father.
- Observed Muslim traders using a remarkable method for performing calculations. (The one we use today.)

Leonardo Fibonacci

- Lived from around 1170 to around 1250; spent most of his life in Pisa. Father an international businessman.
- Traveled to Bugia, in North Africa, as a teenager to join his father.
- Observed Muslim traders using a remarkable method for performing calculations. (The one we use today.)
- That system had been developed in India in the first seven centuries of the first Millennium, and had been learned, used, and carried northwards by Arabic speaking traders who traveled back and forth along the Silk Road. Hence called Hindu-Arabic arithmetic.

- Observed Muslim traders using a remarkable method for performing calculations. (The one we use today.)
- That system had been developed in India in the first seven centuries of the first Millennium, and had been learned, used, and carried northwards by Arabic speaking traders who traveled back and forth along the Silk Road. Hence called Hindu-Arabic arithmetic.
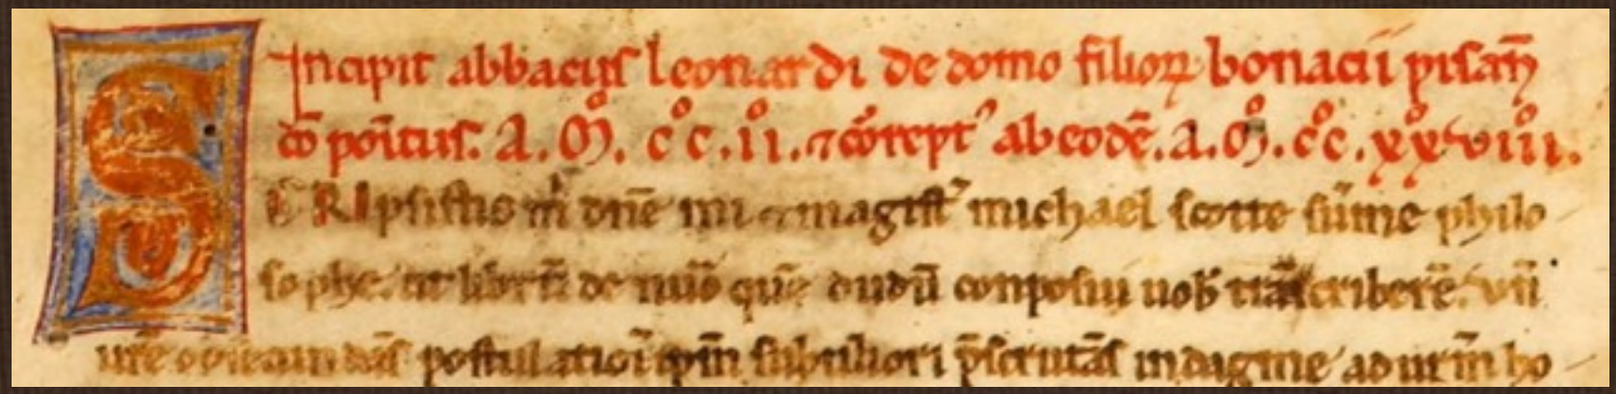
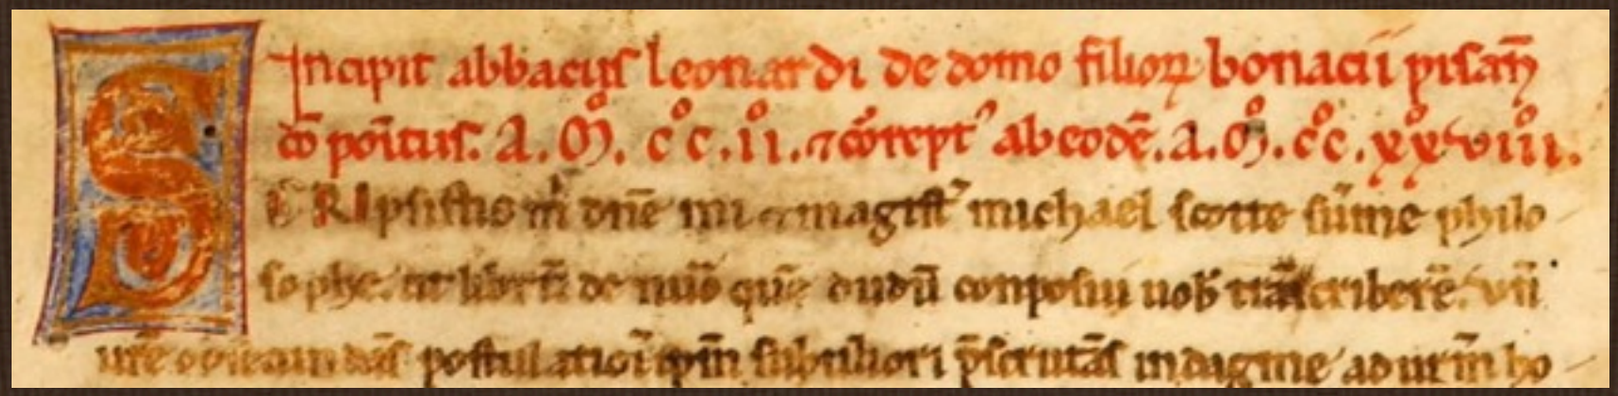
- On his return to Pisa, Leonardo wrote a mammoth book describing this remarkable new way to write numbers and calculate with them, called *Liber abbaci* ("Book of Calculation").
- Completed in 1202, this book is generally credited with bringing the Hindu-Arabic number system and its arithmetic to Europe, and launching the modern, Western-led, commercial world.

What was his real name?



"Here begins the Book of Calculation composed by Leonardo Pisano, Family Bonaci, in the year 1202. [...]"

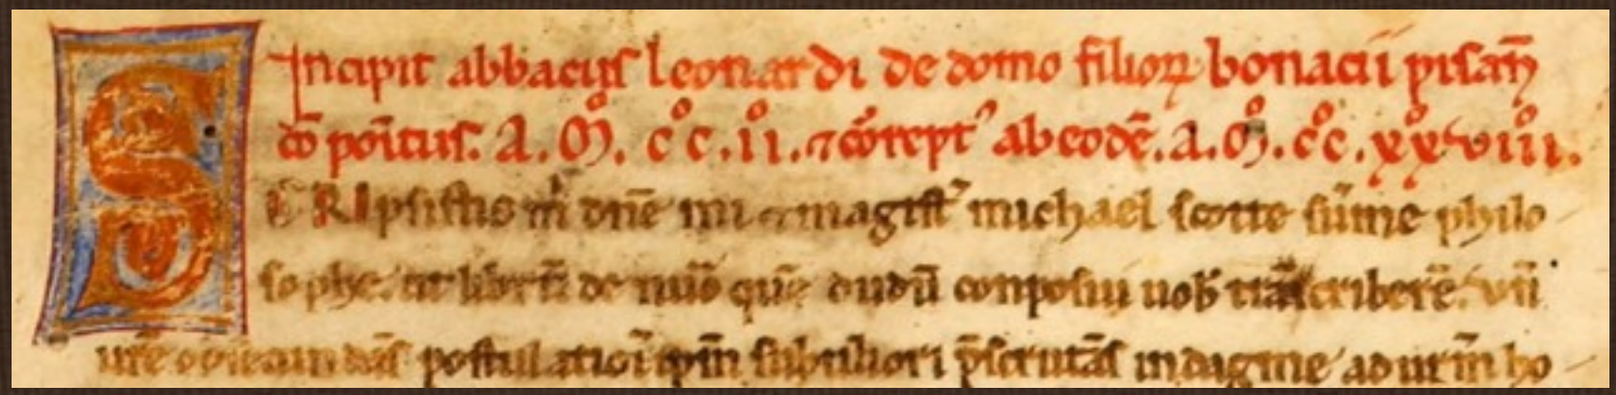
What was his real name?



"Here begins the Book of Calculation composed by Leonardo Pisano, Family Bonaci, in the year 1202. [...]"

- According to the tradition of the time, he would have been known as "Leonardo Pisano" ("Leonardo of Pisa").

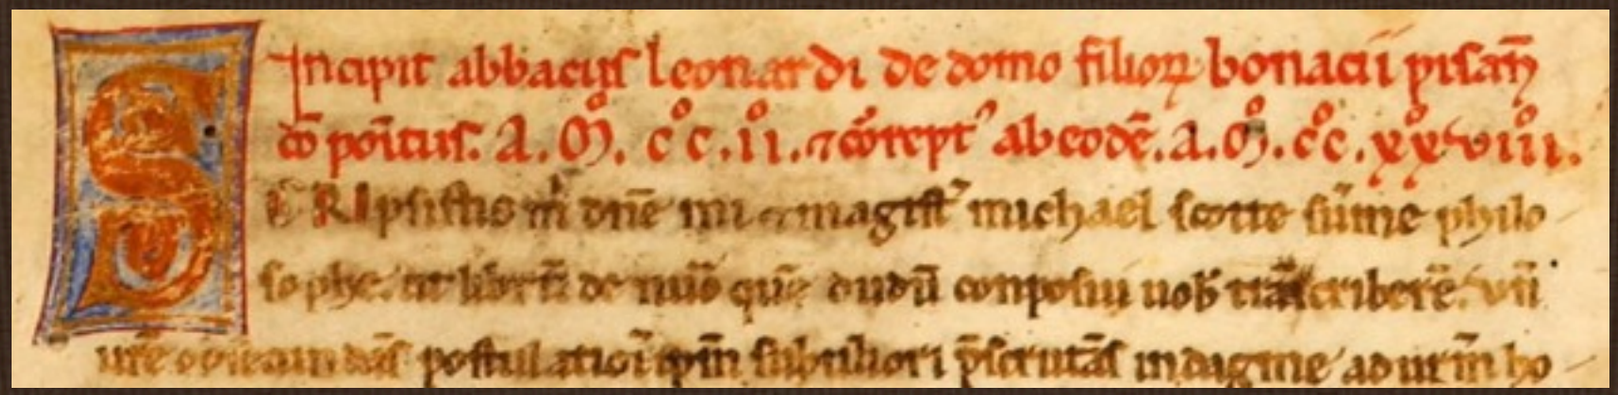
What was his real name?



"Here begins the Book of Calculation composed by Leonardo Pisano, Family Bonaci, in the year 1202. [...]"

- According to the tradition of the time, he would have been known as "Leonardo Pisano" ("Leonardo of Pisa").
- In *Liber abbaci*, he refers to himself as *filius Bonacci* ("son of Bonacci").

What was his real name?



"Here begins the Book of Calculation composed by Leonardo Pisano, Family Bonaci, in the year 1202. [...]"

- According to the tradition of the time, he would have been known as "Leonardo Pisano" ("Leonardo of Pisa").
- In *Liber abbaci*, he refers to himself as *filius Bonacci* ("son of Bonacci").
- We should perhaps translate the phrase as "of the Bonacci family".

What was his real name?

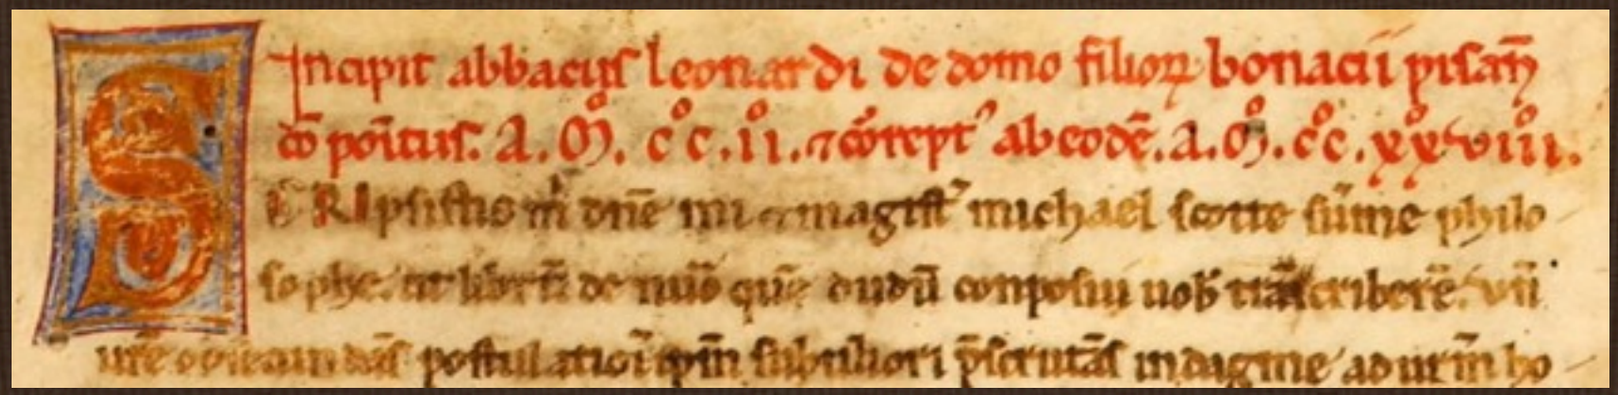
- According to the tradition of the time, he would have been known as "Leonardo Pisano" ("Leonardo of Pisa").
- In *Liber abbaci*, he refers to himself as *filius Bonacci* ("son of Bonacci").
- We should perhaps translate the phrase as "of the Bonacci family".
- The name "Fibonacci" (from *filius Bonacci*) was coined by the historian Guillaume Libri in 1838.

What was his real name?



"Here begins the Book of Calculation composed by Leonardo Pisano, Family Bonaci, in the year 1202. [...]"

- According to the tradition of the time, he would have been known as "Leonardo Pisano" ("Leonardo of Pisa").
- In *Liber abbaci*, he refers to himself as *filius Bonacci* ("son of Bonacci").
- We should perhaps translate the phrase as "of the Bonacci family".
- The name "Fibonacci" (from *filius Bonacci*) was coined by the historian Guillaume Libri in 1838.
- The "Fibonacci sequence" was so named by the French mathematician Edouard Lucas in the 1870s, after Libri coined the nickname Fibonacci.

The Fibonacci sequence

The "Fibonacci sequence", an unending sequence of whole numbers that begins

1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144, 233, 377, …

The rule for generating new numbers in the sequence is that each number is the sum of the two preceding numbers, so 1+1=2, 1+2=3, 2+3=5, etc.

This sequence arises when you solve a particular problem Leonardo gave in *Liber abbaci*:

How Many Pairs of Rabbits Are Created by One Pair in One Year.

A certain man had one pair of rabbits together in a certain enclosed place, and one wishes to know how many are created from the pair in one year when it is the nature of them in a single month to bear another pair, and in the second month those born to bear also.

The numbers of pairs each month are the Fibonacci numbers. You can read off the answer to Leonardo's problem: 377 pairs.

The problem and its solution date back well before Leonardo.

Leonardo's real legacy?

William N. Goetzmann, Edwin J. Beinecke Professor of Finance and Management Studies & Director of the International Center for Finance, Yale University:

"The five-hundred-year period following the appearance of *Liber abbaci* saw the development in Europe of virtually all the tools of financial capitalism that we know today: share ownership of limited-liability corporations, long-term government and corporate loans, liquid and active international financial markets, life insurance, life-annuities, mutual funds, derivative securities, and deposit banking. Many of these developments have their roots in contracts that were based on the mathematical analyses Leonardo introduced to Western Europe through *Liber abbaci*."

In particular, according to Goetzmann, evidence in *Liber abbaci* suggests that Leonardo was the first to develop present-value analysis for comparing the economic value of alternative contractual cash flows. (The present value criterion is now used by virtually all large companies in capital budgeting decision making. The modern present-value formula was developed by economist Irving Fisher in 1930.)

William N. Goetzmann, Fibonacci and the Financial Revolution, in William N Goetzmann and K Geert Rouwenhorst (eds), *Origins of Value: The Financial Innovations that Created Modern Capital Markets*, Oxford University Press, 2005
